GENERAL INFORMATION

Owner of the declaration	Reynaers Aluminium
	Oude Liersebaan 266 B- 2570 Duffel, Belgium
	www.reynaers.com
Manufacturer	Reynaers Aluminium
	Oude Liersebaan 266 B- 2570 Duffel, Belgium
Publisher and Programme holder	EUROPEAN ALUMINIUM AISBL
	Avenue de Tervueren 168
	B-1150 Brussels, Belgium
	2. Ju
	Paul Voss, Director General
The declaration is based on the Product Category	European Aluminium General Programme
Rules	Instructions version 3, 23 rd of September 2020
Declared Unit	1 m ² of curtain wall ElementFaçade7
Scope of the Environmental Product Declaration	This EPD covers 1 m ² of curtain wall type ElementFaçade 7- Double and triple glazing. This EPD has been developed from a modelling tool developed by Sphera via an i-report in GaBi 10. Among the product family, two representative products have been selected and corresponding EPD results have been calculated based on specific bill of materials. These two products refer to double glazing curtain wall and triple glazing curtain wall. The results generated by the collective tool can be considered as a good proxy to model curtain wall produced by Reynaers Aluminium. UN CPC 54710 Glazing Services. The EPD may be used in a B2B context within the European Market.
Liability	The owner of the declaration is liable for the underlying manufacturing information and Europear Aluminium is not liable in this respect.
Disclaimers /erification	This EPD cannot be used as a guarantee of the recycled content of the actual product sold on the market. A specific declaration may be asked from the supplier. The use of this EPD within BIM tools is in principle limited to the products explicitly included in the EPD. The scaling of results to model similar products can only be done if justified and transparently reported in the project report. Any responsibility regarding the misuse of this EPD by third parties is not accepted by the Programme Operator.

EN15804:2012 +A2:2019 serves as core PCR									
completed by European Aluminium PCR 03/2020									
Verification of the EPD by an i	ndepend	dent third party							
in accordance with ISO 14025									
Internally X Externally									

Frank Werner Il Went

1 PRODUCT

1.1 Product description and applications

This Environmental Product Declaration (EPD) is for business-to-business communication. The product object of the EPD is a unitised façade system with an intelligent design and exceptional performance. The prefabricated elements enable a fast and economic installation with limited use of manpower and tooling – certainly compared to traditional curtain walls. The system is compatible with inside and outside opening elements, but also sliding doors for balconies. ElementFaçade 7 can produce very large elements with performances suitable for most high-rise projects, reducing the need for time-consuming and expensive testing.

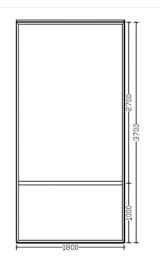

Figure 1 Sketch of the representative product for the curtain wall.

The calculated BoM considers 100% of the mass of the profiles located at the border of the representative product.

EPD results have been calculated for 2 representative products, which are sketched in Figure 1 and detailed in Table 1. There is no integration of operable windows in the representative product.

ID	Model	Size (W x H)	Glazing	Glass surface area (m²)	Glass thickness (mm)
1	EF 7-double glazing	1.8 m x 3.7 m	Double	5,11	24 mm
2	EF 7- triple glazing	1.8 m x 3.7 m	Triple	5,03	30 mm

1.2 Technical Data

The most relevant technical data are reported in Table 2.

Table 2 Most relevant technical data

Category	Description & value	Standards		
Thermal Insulation	Uf-value down to 1.3 W/m ² K depending on the profile/glass combination	EN 12631 EN 13947		
Acoustic performance	Rw(C;Ctr) = 45(-2;-6) dB	EN ISO 10140-3;		
		EN ISO 717-1		
Airtightness	AE 1200 Pa	EN 12153, EN 12152		
Water tightness	RE1200 (1200 Pa)	EN 12155, EN 12154		
Wind load resistance	2400 Pa	EN 12179, EN 13116		
Resistance against impact	I5 + E5	EN 14019		

For the most up-to-date values of the technical data, please refer to the product specifications available on the Reynaers website (<u>www.reynaers.com/consumers/our-products</u>).

The most relevant standard for applications of aluminium curtain walls in buildings is EN 13830

1.3 Process description

The entire installation process is typically performed at the job site.

The following operations are carried out for the production of the main parts:

- 1. Aluminium profile (powder coated) preparation mainly via sawing, and milling.
- 2. Frame production by assembling the various profiles via connectors and fixing via bolting or glueing. Connectors used are mostly composed of aluminium.
- 3. Positioning and fixing the various gaskets.
- 4. Infill application (e.g. glazing, opaque panels).
- 5. The hardware integration (if relevant).

The main background production processes are reported in Figure 2.

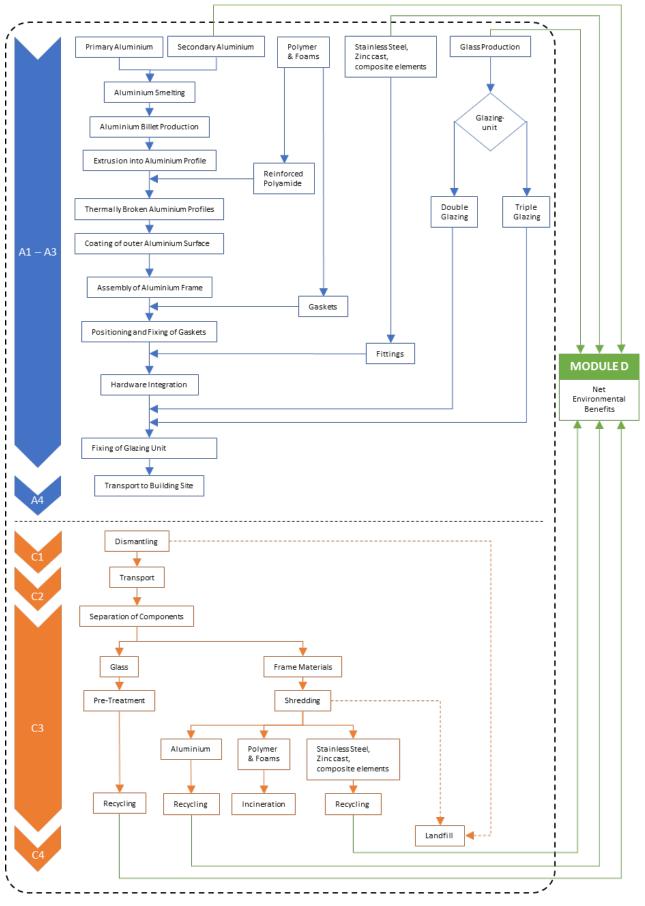

Figure 2 Main production processes and components of the curtain wall

The upstream aluminium processes have been modelled using European Aluminium LCI datasets for the primary aluminium production, recycling and remelting as described in the European Aluminium Environmental profile report 2018.

For the other processes and materials, e.g. gaskets, glass unit or hardware, datasets from the GaBi database have been used. The powder coating of aluminium profiles has been modelled using GaBi datasets as well.

At end-of-life, thanks to their high price value (i.e. about 50% of the LME price) aluminium frames and profiles are systematically dismantled and collected for sending them to recycling. After being collected, the curtain walls are treated through shredding and sorting. However, the glazing unit might not be systematically collected at the building renovation or demolition site. Hence, two extreme end-of-life scenarios have been used for flat glass: 100% recycling or 100% landfilling.

1.4 Health and safety aspects during production and installation

There are no critical health and safety aspects during the production of aluminium curtain walls. The pre-treatments used for the pre-treatment of aluminium profile do not contain chromium nor other substances of very high concern (SVHC substances), and this process is followed by a coating process realised using a powder without VOC.

There are no relevant aspects of occupational health and safety during the further processing and installation of Reynaers curtain walls. Under normal installation, no measurable environmental impacts can be associated with the use of Reynaers aluminium curtain walls. The appropriate safety measures need to be taken at the building site, especially if installation takes place on a high-rise building.

1.5 Reference service life

Since the use phase is not modelled, no specific information can be given about the Reference Service Life. In normal use, aluminium building products are not altered or corroded over time. A regular cleaning (e.g. once a year) of the product suffices to secure a long service life. However, the use of highly alkaline (pH >10) or highly acidic (pH < 4) cleaning solutions should be avoided. In practice, a service life of 50 years can be assumed in normal use for such application, except for the IGU (Insulated Glass Unit) which needs to be replaced usually after 30 years due to slow degradation of its performance.

2 LCA – CALCULATION RULES

2.1 Declared unit & bill of materials

The Bill of Materials of the two analysed products is reported in Table 3. The declared unit corresponds to 1 m^2 of curtain wall.

Table 3 Bill of materials (kg) of the declared unit for 2 products

Reference					
Turno	EF 7-Doub	ole glazing	EF 7-Triple glazing		
Туре	kg	%	kg	%	
Glass	46,1	81,14%	56,6	84,83%	
Aluminium	8,51	14,98%	8,34	12,50%	
Metal parts	0,00811	0,01%	0,00811	0,01%	
Thermal break	0,637	1,12%	0,637	0,95%	
Gasket	1,53	2,69%	1,11	1,66%	
Foams	0,029	0,05%	0,029	0,04%	
Total	56,81	100%	66,72	100%	

2.2 System boundary

This EPD is from cradle to gate with modules C1-C4 and module D, as reported in Table 4.

The production stage (modules A1-A3) includes processes that provide materials and energy input for the system, manufacturing and transport processes up to the factory gate, as well as waste processing. For the end-of-life, the default scenario defined in the General Product Instructions and detailed in 3.2 is applied.

	Production			Installati on			Use stage						End-o	of-Life		Next product system	
-	Raw material	Transport	Manufacturing	Transport to	Installation	Use	Maintenance	Repair	Replacement	Refurbishment	Operational energy	Operational water	Deconstruction	Transport	Waste processing	Disposal	Reuse, recovery, recycling potential
A	1	A2	A3	A4	A5	B1	B2	B3	B4	B5	B6	B7	C1	C2	С3	C4	D
X	(х	х	х	ND	ND	ND	ND	ND	ND	ND	ND	х	х	х	х	Х

Table 4 Modules declared

Note: ND: Not Declared; X: Module included in the LCA.

Module A4 is declared for a distance of 1 km to give the possibility to adjust the resulting environmental impact depending on the specific distance at hand.

2.3 Energy mix

In the models developed the background electricity mix used is the European electricity mix (EU-28 Electricity grid mix (2017)). Details about the electricity modelling in the datasets: production of primary aluminium, extrusion, rolling and recycling please refer to the Environmental Profile Report 2018.

2.4 Allocation

The scrap which are produced along the production chain are recycled into the same production chain and are modelled as "closed-loop" within Module A. This recycling loop has been modelled in the GaBi model so that the curtain wall is the only product exiting the gate. Hence, the production process does not deliver any co-products.

At the end-of-life stage, the curtain walls are sent to an end-of-life treatment which is modelled according to the scenario reported in 3.2. The environmental burdens and benefits of recycling and energy recovery are calculated in module D accordingly.

2.5 Assumptions and Cut-off criteria

The aluminium profiles were composed of a mix of 34% primary aluminium, low carbon primary aluminium 26% and 40% recycled aluminium. For the primary aluminium, a primary aluminium ingot consumption mix was considered (European production + net fraction of imports into Europe), whereas for low carbon primary aluminium the data reported in the EPD of the manufacturer has been used, where possible, or a primary aluminium production has been considered as a proxy. Alloying elements were not considered, and a pure aluminium profile has been assumed as a proxy.

2.6 Data quality

Representativeness

Technological: All primary and secondary data were modelled to be specific to the technologies or technology mixes under study. Where technology-specific data were unavailable, proxy data were used. For the aluminium production, extrusion profiles and recycling, the datasets described in the Environmental Profile Report 2018 of European Aluminium have been used and integrated with the EPD profile of the low carbon primary aluminium. The modelling reflects the specific BoM of the analysed products. Technological representativeness is considered to be very good.

Geographical: All primary data were collected specifically to the countries under study. Regarding secondary data, where EU region-specific data were unavailable, DE datasets were used. For the aluminium production, extrusion profiles and recycling, the datasets described in the Environmental Profile Report 2018 of European Aluminium have been used. Geographical representativeness is considered to be good.

Temporal: Primary data refer to the year 2020, and all secondary data come from the GaBi database SP40, including those on aluminium production, which are the most recent ones as described in the Environmental Profile Report 2018 of European Aluminium.

<u>Completeness</u>

All known operating data was taken into consideration in the analysis. Based on earlier studies conducted by European Aluminium, it can be assumed that the ignored processes or flows contribute to much less than 5% of the impact categories under review.

The process chain is considered sufficiently complete regarding the goal and scope of this study.

Overall, the data quality can be described as good.

2.7 Software and databases

These EPD results have been calculated from an LCA tool for EPD, based on the GaBi database. Currently, the EPD software is using the software GaBi V10.5.0.78 and the Service Pack 40 (SP40).

2.8 Comparability

As a general rule, a comparison or evaluation of EPD data may be possible when all of the data to be compared has been drawn up in accordance with EN 15804 and the building context or product-specific characteristics are taken into consideration.

3 LCA – SCENARIOS AND ADDITIONAL INFORMATION

3.1 Scenario for additional modules

Module A4 is taken into consideration in this Declaration, and it has been modelled according to the information reported in Table 5.

Table 5 Module A4 – Transport to the building site

Scenario information	Unit (expressed per DU)
Fuel type and consumption of vehicle or vehicle	Truck-trailer, Euro 4, 34 - 40t gross weight / 27t
type used for transport e.g. long-distance truck,	payload capacity, diesel driven
boat, etc.	
Distance	1 km
Capacity utilisation (including empty returns)	61 %
Bulk density of transported products	-
Volume capacity utilisation factor (factor = 1 or	Not applicable
<1 or ≥1 for compressed or nested packaged	
products)	

3.2 Scenario for Mod. C1-C4

The default scenario for the end-of-life of the curtain wall, as reported in the General Programme Instructions, is the following:

- collection rate: 99%;
- shredding efficiency: 95%;
- scrap recycled through refining process: 96,5%
- overall aluminium recycling rate: 91%

For the glass used in the sliding systems, two extreme end-of-life scenarios were modelled: one with 100% recycling of the glass and one with 100% landfill of the glass.

Table 6 reports the main parameters of the end-of-life scenarios for the main materials and components.

Table 6 Parameters of the end-of-life scenarios for the main materials and components, related to the DU

Processes	or DU of co	essed per FU omponents, r materials e of	EF 7-Doul	ble glazing	EF 7-Triple glazing		
			Scenario 100%	Scenario 100%	Scenario 100%	Scenario 100%	
			glass landfill	glass recycling 46,1 kg	glass landfill	glass recycling 56,6 kg

process	kg collected	separately	Gasket:	: 1,52 kg	Gasket	:: 1,1 kg	
specified by type			Metal fittings and kg	others: 0,69543	Metal fittings and	others: 0,69543 kg	
	Kg collected constructior		(0		D	
	Kg for re-use		(0	(D	
	Va fan naam	lin -	0	Glass: 44,6 kg	0	Glass: 54,8 kg	
Recovery system specified	Kg for recyc	ling	Aluminium fi	rame: 7,52 kg	Aluminium fi	rame: 7,38 kg	
by type			Metal fitting	s: 0,00763 kg	Metal fittings: 0,00763 kg		
	Kg for energ	y recovery	Gaske	et: 0 kg	Gasket: 0 kg		
			Other	rs: 0 kg	Others: 0 kg		
		Landfill		ım frame: 76 kg		m frame: 57 kg	
		Waste incineration	Gasket: 0,0912 kg		Gasket: 0,0663 kg		
Disposal specified by type	Kg product or material for final deposition	Landfill (inert materials) and waste incineration (plastics)	Fittings and oth	ers: 0,040102 kg	Fittings and others: 0,040102 kg		
		Landfill	Glass: 46.1 kg	0	Glass: 56,6 kg	0	

Note to Table 6:

Material collected separately: This amount refers to the waste stream collected separately per material before being subjected to shredding

Material for recycling: This amount refers to the waste stream sent to recycling per material after the shredding and/or sorting process.

Material for final deposition – aluminium: this amount includes the aluminium not collected separately and the shredding losses.

3.3 Scenario Mod. D

Module D includes:

- a transport from the scrap dealers to the recycling plants, considering an average distance of 200 km;
- recycling of Aluminium through refining;
- a net credit for the avoided production of primary aluminium;
- a net credit for the avoided production of flat glass (for 100% glass recycling scenario)

The calculation of module D has been implemented in line with the General Programme Instructions of European Aluminium, thus based on the difference between the scrap used at the input and output side. In some cases, this may result in environmental burdens instead of environmental benefits if the product system is a net consumer of valuable secondary material.

3.4 Additional environmental information

During use, the indoor air quality, i.e. VOC emission, is not affected by aluminium curtain walls. In case of fire, aluminium is a non-combustible construction material (European Fire Class A1) in accordance with Commission Decision 96/603/EC and does therefore not make any contribution to fire.

4 LCA RESULTS – CURTAIN WALL EF 7-Double glazing

4.1 Result of the LCA – Environmental impact curtain wall EF 7-Double glazing, 1 m²

The tables below report the results of the LCA study for the two glass scenarios: 100% recycling and 100% landfill.

4.1.1 Core environmental impact indicators

Scenario 100% glass recycling

6 LCA – INTERPRETATION

The results are analysed and interpreted for modules A1-A3 and modules C1-D. Results for module A4 are not further interpreted, as calculated only for 1 km.

Production stages: modules A1 to A3.

The biggest contributor to the environmental impacts is aluminium production which is influenced by the mass of aluminium in the declared unit: the higher the aluminium mass, the higher the indicator. Hence, the GWP indicator evolves from 1,18E+02 [kg CO2-eq] for EF 7-Double glazing to 1,35 E+02 [kg CO2-eq] for EF 7-Triple glazing.

Within the aluminium production processes, the primary aluminium production is dominant, especially the alumina production and the electrolysis. The recycled ingot production, which presents a much lower impact than the primary ingot production, is used in Module A1-A3 for the fraction of aluminium coming from recycling. The extrusion process which converts ingot, i.e., billets, into profile is much less significant. The LCA modelling and the impact of the primary aluminium production are detailed in the Environmental Profile Report 2018.

End-of-life stage: modules C1-C4 and module D

Modules C1-C3: they are negligible for all products compared to modules A1-A3 (<2,5% for scenario 100% glass recycling and <4,4% for scenario 100% glass landfill).

Module C4: the C4 (disposal) is very limited (<4,7%) compared to modules A1-A3 and module D.

Module D: environmental benefits come from the recycling of aluminium. It is about 48% of GWP savings, for scenario 100% glass recycling, are obtained in Module D compared to the value calculated for module A1-A3 and about 28% for scenario 100% glass landfill. These calculations show the relevance to consider Module D in the full assessment of curtain wall in the building context.

7 OTHER INFORMATION

Reynaers Aluminium is founded on the concept of corporate responsibility and includes recognition of the need for positive actions and continuous support and development of the local communities that neighbour our facilities.

Through its Environmental Management System, certified according to ISO 14001:2015, Reynaers Aluminium actively implements best practices regarding environmental protection through significant investments and measures, by optimizing the production cycle, implementing new procedures that reduce the energy footprint of our plants, and the vigilant prevention of any possibility of environmental pollution.

Additional information about Reynaers Aluminium's corporate responsibility and sustainability policy and the products can be found on the Reynaers Aluminium website <u>www.reynaers.com</u>.

These EPD results have been calculated from an LCA tool for EPD, based on the GaBi database, initially realised by thinkstep GmbH in 2013 and updated by Ecoinnovazione in 2019 (Ecoinnovazione S.r.l. – spin-off ENEA Via della Liberazione, 6/c, 40128 Bologna BO <u>www.ecoinnovazione.it</u>)
